

EPA 10012017 Release Notes

EPA 10012017 Release Notes:

This is a small increment to add a new property for managing http connections.

Software Changes:

- Add the property

```
HTTP.SECURITY.MAX.TOTAL.CONNECTIONS=25
```

This is to manage the number maximum number of connections the EPA http client will hold. Increase this number if the application requires a high load of concurrent requests.

Deployment Process Changes:

- None

Known Issues:

One of the Ecom operations used by the Portugal OpCo ([getTransaction17](#)) cannot be translated into a DecouplingApi call. This is because as a security measure it was decided that requests to operations like this must include the msisdn from any client to ER Core. To make a request without it, is no longer supported.

So Portugal have agreed to change their request so that it includes an msisdn. Until this change is implemented we will have to continue to use the Ecom Api in this particular case. In effect this means EPA should have the operation configure as such for PT:

```
proxy.getTransaction17=false
```

Further Notes:

- None
